

ABSTRACT OF THE DISCLOSURE

1 For designing communication paths of tree in a network, an objective  
2 function is defined for minimizing a number of candidate tree graphs for  
3 accommodating said communication paths and a first constraint equation is  
4 defined for causing all of the candidate tree graphs to form a tree. A second  
5 constraint equation is defined for accommodating the communication paths in  
6 one of the candidate tree graphs. A third constraint equation is defined for  
7 determining whether each of the candidate tree graphs is used to accommodate  
8 the communication paths. A mathematical programming problem formed by  
9 the objective function, and the first, second and third constrain equations is  
10 solved to obtain a plurality of trees in which the communication paths can be  
11 accommodated.
